**BINDURA UNIVERSITY OF SCIENCE EDUCATION**  
**Faculty of Science and Engineering**  
**Department of Engineering and Physics**

**BACHELOR OF SCIENCE EDUCATION HONOURS DEGREE**

**Physics**

**PH208**

**Solid State Physics I**

**Duration: Three (3) Hours**

***Answer ALL parts of Section A and any THREE questions from Section B.  
Section A carries 40 marks and each question of Section B carries 20 marks.***

***Clearly show ALL working***

**You may not start to read the questions  
printed on the subsequent pages until  
instructed to do so by the Invigilator.**

$$1\text{\AA} = 10^{-10}\text{m} = 10\text{ nm}$$

$$\text{Avogadro's number, } N_A = 6.0225 \times 10^{23} \text{ mol}^{-1}$$

$$\text{Boltzmann constant, } k_B = 1.381 \times 10^{-23} \text{ JK}^{-1}$$

$$\text{Permittivity of vacuum, } \epsilon_0 = 8.8542 \times 10^{-12} \text{ Fm}^{-1}$$

$$\text{Dirac's constant, } \hbar = 1.054 \times 10^{-34} \text{ kgm}^2\text{s}^{-1}$$

$$\text{Electron charge, } e = -1.602 \times 10^{-19} \text{ C}$$

$$\ln(1+x) = \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} x^n; \quad e^{\pm ix} = \cos x \pm i \sin x; \quad \sin^2 x = \frac{1}{2} (1 - \cos 2x)$$

### Lennard-Jones potential

$$U_{total}(R) = 2N\epsilon \left[ \sum_j \left( \frac{\sigma}{p_{ij}R} \right)^{12} - \sum_j \left( \frac{\sigma}{p_{ij}R} \right)^6 \right]$$

|            | $\sum_j p_{ij}^{-12}$ | $\sum_j p_{ij}^{-6}$ |
|------------|-----------------------|----------------------|
| <i>bcc</i> | 9.11418               | 12.2533              |
| <i>fcc</i> | 12.13188              | 14.45392             |

### Moseley's law

$$\sqrt{\nu} = a(Z - 1)$$

## Periodic Table of the Elements

\*\*Actinide series

Note: Atomic mass values given are averaged over isotopes in the percentages in which they exist in nature.  
<sup>†</sup> For an unstable element, mass number of the most stable known isotope is given in parentheses.

<sup>††</sup> Elements 113, 115, 117, and 118 have not yet been officially named. Only small numbers of atoms of these elements have been observed.  
*Note:* For a description of the atomic data, visit [physics.nist.gov/PhysRefData/Elements/per\\_text.html](http://physics.nist.gov/PhysRefData/Elements/per_text.html).

## SECTION A

1. (a) Comment on the validity of the assertion that *X-ray production is the inverse of the photoelectric effect*. [2]
- (b) When illuminated by X-rays, explain why the X-ray diffraction spectra for ordinary glass (composition  $SiO_2$ ) exhibit one or two diffuse rings on the recording film whilst glass in the form of quartz (composition  $SiO_2$ ) exhibits a large number of rings. [3]
- (c) The X-ray spectrum of a cobalt target ( $Z = 27$ ) contains a strong  $K_\alpha$  line of wavelength  $0.1785\text{ nm}$  and weak  $K_\alpha$  lines having wavelengths of  $0.2285\text{ nm}$  and  $0.1537\text{ nm}$  due to impurities. Use Moseley's law to identify the impurities. The constant for  $K$ -series may be taken as unity. [10]
- (d) Tungsten is a metal with the body centred cubic (bcc) structure. Its density is  $19.25\text{ g cm}^{-3}$  and its atomic weight is  $183.84\text{ g mol}^{-1}$ .
- (i) Find the nearest neighbour and second nearest neighbour distances in tungsten. [6]
- (ii) How many nearest neighbours does an atom in this structure have? [4]
- (e) The density of gold in the face centred cubic (fcc) structure is  $1.93 \times 10^4\text{ kg m}^{-3}$  and its atomic weight is  $197\text{ g mol}^{-1}$ .
- (i) Find the separation between the close packed planes. [4]
- (ii) Assuming that the atoms are spheres which just touch one another, estimate the atomic radius. [4]
- (f) Show that the Madelung constant for a linear ionic solid having  $2N$  ions of alternate charges  $\pm q$  is  $2\ln 2$ . [5]
- (g) What was the physical significance of the von Laue photograph? [2]

## SECTION B

2. Consider the normal modes of a linear chain in which the force constants between nearest-neighbour atoms are alternately  $K$  and  $G$ . For equal masses and nearest-neighbour separation  $a/2$ , the lattice dynamics of the chain is given by

$$\begin{bmatrix} M\omega^2(k) - K - G & K + Ge^{-ika} \\ K + Ge^{ika} & M\omega^2(k) - K - G \end{bmatrix} \begin{bmatrix} \epsilon_1 \\ \epsilon_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- (a) Show that the dispersion relations are given by

$$M\omega_{\pm}^2(k) = \left( K + G \pm \sqrt{K^2 + G^2 + 2KG\cos(ka)} \right) \quad [5]$$

- (b) Find  $\omega_{\pm}(k)$  at  $k = 0$  and  $k = \pi/a$  for the case  $K = 10G$ . Sketch the dispersion relation. [5]

- (b) Discuss the dispersion relation and the Brillouin zone the limit  $G \rightarrow K$ . [5]

- (c) Describe what happens when you take the limit  $K \rightarrow \infty$ . [5]

3. (a) Distinguish between the linear absorption coefficient ( $\mu$ ) and the mass absorption coefficient ( $\mu_m$ ) of a material. Describe the way in which  $\mu_m$  varies with the wavelength of the incident X-rays. [6]

- (b) The  $K$ -absorption edge of molybdenum ( $Mo$ ) is at  $0.6198 \text{ \AA}$ .

- (i) Find the energy (in  $keV$ ) required to remove a  $K$  electron from a  $Mo$  atom. [2]

- (ii) What is the corresponding potential difference that must be applied across an X-ray tube to excite  $K$  spectra of  $Mo$ ? [2]

- (iii) If the  $L$  absorption edge of for  $Mo$  is at  $4.912 \text{ \AA}$  estimate the wavelength of the  $K_{\alpha}$  line. [4]

- (c) Find the  $CrK_{\alpha}$  linear absorption coefficient for chromite ( $FeCr_2O_4$ ) with a density of  $5.05 \text{ gcm}^{-3}$ , using the physical data provided below:

| Element   | Atomic weight ( $g$ ) | $\mu_m (\text{cm}^2 \text{g}^{-1})$ |
|-----------|-----------------------|-------------------------------------|
| <i>Fe</i> | 55.85                 | 115                                 |
| <i>Cr</i> | 52.00                 | 89.9                                |
| <i>O</i>  | 16.00                 | 40.1                                |

- (d) What thickness of chromite powder (packing fraction 0.54) would be required if only 1 % of an incident beam of  $CrK_{\alpha}$  X-rays is to be transmitted? [4]

4. (a) Find the atomic packing fraction for a simple cubic (sc) structure. [4]
- (b) Sketch part of a simple cubic (sc) structure and indicate on it the (110) and (111) planes. [2]
- (c) For such a lattice of spherical atoms, of radius  $0.16 \text{ nm}$ , find the areal density ( $\text{atoms}/\text{m}^2$ ) on each of the planes in part (b). [8]
- (d) A second type of spherical atom just fits into the centre of each cubic cell. Find its radius and the atomic packing fraction of the modified structure. [6]
5. (a) Discuss models for the different types of bonds that form stable molecules. [8]
- (b) A particle of mass  $m$  moves in one-dimensional motion through a field for which the potential energy of the particle-field system is
- $$U(x) = \frac{A}{x^3} - \frac{B}{x}$$
- where  $A$  and  $B$  are constants.
- (i) Find the equilibrium position  $x_0$  of the particle in terms of  $A$  and  $B$ . [4]
- (ii) Determine the depth  $U_0$  of this potential well. [3]
- (iii) In moving along the  $x$ -axis, what maximum force toward the negative  $x$  direction does the particle experience? [5]

6. The amplitude diffraction beam associated with a reciprocal lattice vector  $\vec{G} = h\vec{b}_1 + k\vec{b}_2 + l\vec{b}_3$  is given by the expression  $F_G = NS_G$  where  $N$  is the number of primitive unit cells in the crystal, and the structure factor  $S_G$  is given by

$$S_G(h, k, l) = \sum_j f_j \exp[-2\pi i(hx_j + ky_j + lz_j)]$$

The sum is over all basis atoms at

$$\vec{r}_j = x_j\vec{a}_1 + y_j\vec{a}_2 + z_j\vec{a}_3$$

and  $f_j$  is the atomic form factor. In this problem you may assume  $f_j = f$  is a constant.

- (a) Using the conventional cubic cell as the unit cell for the face centred cubic (*fcc*) lattice, write down the positions  $\vec{r}_j = (x_j, y_j, z_j)$  of the basis atoms. Show that the amplitude of a diffraction beam will be zero unless (*hkl*) are either all odd or all even.

[10]

- (b) What is the relative spacing of the (110) planes in the *fcc* lattice compared to a simple cubic (*sc*) lattice with the same cubic unit cell size? Use this to explain why the (110) diffraction beam of the *sc* lattice ( $n = 1$ ) has an amplitude of zero for the *fcc* lattice.

[10]

END OF PAPER
